Abstract

In 2012, the Accreditation Council for Graduate Medical Education (ACGME) designated ultrasound (US) as one of 23 milestone competencies for emergency medicine (EM) residency graduates. With increasing scrutiny of medical educational programs and their effect on patient safety and health care delivery, it is imperative to ensure that US training and competency assessment is standardized. In 2011, a multiorganizational committee composed of representatives from the Council of Emergency Medicine Residency Directors (CORD), the Academy of Emergency Ultrasound of the Society for Academic Emergency Medicine (SAEM), the Ultrasound Section of the American College of Emergency Physicians (ACEP), and the Emergency Medicine Residents’ Association was formed to suggest standards for resident emergency ultrasound (EUS) competency assessment and to write a document that addresses the ACGME milestones. This article contains a historical perspective on resident training in EUS and a table of core skills deemed to be a minimum standard for the graduating EM resident. A survey summary of focused EUS education in EM residencies is described, as well as a suggestion for structuring education in residency. Finally, adjuncts to a quantitative measurement of resident competency for EUS are offered.

Emergency ultrasound (EUS) in emergency medicine (EM) has developed substantially since the American College of Emergency Physicians (ACEP) first published a position statement in 1990 supporting the performance of EUS by appropriately trained physicians.1 Soon thereafter, the Society for Academic Emergency Medicine (SAEM) endorsed this position and recommended the development of a training curriculum.2 In 1994, Mateer and colleagues3 published the model curriculum for physician training in EUS and by 1996 the EM core content curriculum required EUS competency for residency graduates. A landmark resolution by the American Medical Association in 1999 (Resolution 802 and policy H-230.960) stated that ultrasound (US) is “within the scope of practice of appropriately trained physicians” and that each specialty should decide the necessary training requirements for sonography competency.4 ACEP further developed the standard recognition of EUS as “a skill integral to the practice of EM” in the 2001 Model of the Clinical Practice of Emergency Medicine (EM Model), which resulted in the Accreditation Council for Graduate Medical Education (ACGME) mandating that all EM residents attain competency in the use of EUS by the completion of residency training.5 In 2008, as an update and revision, ACEP published more comprehensive specialty-specific guidelines as a standard for EUS.6 Subsequently, SAEM, the Council of Emergency Medicine...
Residency Directors (CORD), and the American Institute of Ultrasound in Medicine have recognized this document.7–9

The 2008 document “Resident Training in Emergency Ultrasound: Consensus Recommendations from the 2008 Council of Emergency Medicine Residency Directors Conference” introduced a suggested model EUS curriculum to assist program directors by providing minimum education standards for the integration of EUS into resident education.7 Given the rapid growth of EUS at all levels of residency training, and the newly announced ACGME milestones for resident EUS education, there has been an emerging need for an updated framework for EM resident education with suggested standardized components.

The specific term “emergency ultrasound” (or EUS) is used throughout this document to maintain clarity and simplicity and to acknowledge the role EM has played in the history and development of the field. Associated terminology such as “point-of-care ultrasound,” “bedside ultrasound,” “focused ultrasound,” or “limited ultrasound” will not appear. These terms are often used interchangeably as EUS skills apply to other clinical specialties and are a part of a larger field of bedside, clinical, provider-performed, point-of-care US.

### IMPACT OF EUS TRAINING

Established in 1989, the Agency for Healthcare Research and Quality (AHRQ) focuses on improving the quality, safety, efficiency, and effectiveness of health care for all Americans. The AHRQ Evidence Reports and Technology Assessments are published to improve quality, safety, ef

...amt discrepancy in the total number of scans required of residents, the number of weeks the residents have dedicated to an EUS rotation, and the means by which resident EUS competency is assessed (see Data Supplement S1, available as supporting information in the online version of this paper). Notably, 25% of EM program directors reported that no minimum number of scans was required before graduation. Although the majority of programs dedicate 3 to 4 weeks of their residency curriculum to EUS, there were nearly 20% that devote 1 to 2 weeks only. Of note, the authors do not feel that 1 to 2 weeks is sufficient to ensure progression in the EUS subcompetencies.

### ORGANIZATION OF AN EUS RESIDENT ROTATION

This section provides a suggested framework for an EUS rotation as a tool and guideline for program directors and EUS educators. Emphasis is placed on asynchronous Web-based learning coupled with active hands-on learning. Movement away from the traditional passive learning with a majority of the rotation composed of didactic lectures in the classroom is encouraged. These recommendations are based on the experience of the writing group as well as the consensus opinion of EUS resident educators in online discussion groups, listservs, and published documents.7

#### Rotation Length

For novice sonographers in the postgraduate year (PGY)-1 or PGY-2 years, an EUS beginner track rotation should ideally be 4 weeks in duration. Currently,
roughly two-thirds of EM program director respondents allocate this amount of time for a rotation.

**Beginner Track**

EUS educators note that consideration should be made to create a beginner and an advanced EUS education track. Dividing residents into tracks may allow a better educational experience for the resident and a better ability of the educator to assess the appropriate subcompetency progression. A focused introduction to EUS will ensure that residents obtain the necessary fund of knowledge and essential technical skills for self-directed learning throughout residency. While residents will use this training period to develop an understanding of examination indications and technique, they should finish the rotation with the understanding that the goal of EUS education is to foster a mature integration of these newly acquired skills into routine ED patient care (Level 1, 2, and 3 subcompetencies). A longitudinal model that schedules 2 weeks in the first year and 2 weeks in the second year of training could offer the benefit of clinical experience in integrating a meaningful understanding of EUS. That being said, many EUS educators recommend that the 4-week rotation occur in the first year of training.

**Advanced Track**

An organized advanced track for residents in the PGY-3 or PGY-4 years should focus on fostering the incorporation of EUS into appropriate clinical scenarios during routine patient care (Level 4 and Level 5 subcompetencies). This track would offer senior residents an opportunity not only to teach the more junior residents, but also to learn advanced EUS techniques and participate in the quality assessment of US studies performed in the department. Optional additional rotations, such as senior electives, independent study, and/or research efforts in EUS should be encouraged and may be tailored for interested residents.

**Allocation of Rotation Hours and Didactic Learning**

With the increasing availability of online education for EUS (e.g., Web-based lectures, podcasts, case-based learning, and online tutorials), traditional didactic teaching has a lot of competition. Online tools have been demonstrated to be as effective as traditional didactic teaching when learning US-guided procedures such as vascular access. Although the evidence that asynchronous EUS learning can be equal to traditional didactic lecturing has not been proven for all applications, there is great support for the majority of in-person EUS education occurring at the patient’s bedside. Dynamic US simulators or static task trainers may be acceptable alternatives for bedside learning. Damewood et al. demonstrated that image acquisition and interpretation skills for novice physician sonographers performing the focused assessment of sonography in trauma examination were similar whether using a multimedia simulator or a human model. We recommend that the majority of the in-person rotation hours be directly supervised by attending physicians or EUS fellows (if present at the institution) to foster the early development of proper scanning technique. All resident US images should be reviewed during weekly quality assurance meetings to ensure that timely and instructive feedback is provided during the acquisition of these core skills.

PGY-1 residents are likely first exposed to US in a structured fashion during the EM residency orientation period. With increasing frequency, they will have been exposed to US in medical school; however, the exposure will remain variable for at least the near future. The information covered during the orientation period should serve as a means of standardizing knowledge and skills among the incoming interns. The EUS rotation can then build on the introductory concepts and skills.

**Timing of EUS Rotation**

We suggest that the EUS rotation should be scheduled during the PGY-1 year to ensure that residents complete a beginner track and develop EUS skills early in their residency training. This will allow adequate time in residency to focus on the integration of EUS into clinical care.

**Resident US Skills**

The 2008 CORD consensus recommendations, the ACEP 2008 practice guidelines, and consensus through discussion forums and list-serves form the basis for the following skills table.

**Core and Advanced Skills**

Core skills represent the expected minimum US application content learned by EM residents. Advanced skills are those specific to an EUS fellowship curriculum core content (see Data Supplement S2, available as supporting information in the online version of this paper). An example of how the EUS subcompetency could be integrated into the care of patients with different clinical syndromes is demonstrated in Data Supplement S3 (available as supporting information in the online version of this paper).

**RESIDENT COMPETENCY ASSESSMENT**

Meeting the ACGME Milestones for EUS in EM requires not only resident education but also knowledge and performance assessment. This section will focus on the concepts of effective assessment and evaluation for EUS competency. Residents should be prepared for practice consistent with the EM Model for which EUS is an integral procedural skill.

Because of the clinical nature of EUS, the progression of learners and the related assessment is well characterized by Miller’s framework or pyramid. This framework describes a process of acquisition of knowledge, understanding of how to apply that knowledge, application and demonstration of that knowledge, and integration of that knowledge into practice. Each stage should be evaluated separately and competent performance in one area does not guarantee similar performance in another. It is also clear that assessment of more complex tasks, such as the integration of US into clinical decision-making and patient care, cannot be assessed in a single format, and requires multiple assessment methods.
The resident’s fund of knowledge, or simple fact recall, can be assessed through the use of standardized testing, which is a well-known, accepted, and validated format. The use of essay-type questions or clinical vignettes can evaluate the application of knowledge and facts. Standardized tests with both types of question formats are widely available for use. Selected questions from each content area can assess fund of knowledge, ideally for more basic level competencies.

Higher-level assessments become more complex and involve evaluating the effective transition from knowledge recall into performance. It is at this level that competency assessments can begin and learners move past the purely cognitive elements of fact recall and on to the application. At this level the residents demonstrate their ability to perform and interpret EUS as they apply previously acquired knowledge. Competency in EUS can be assessed in several formats, including simulation environments, direct observation, and structured examinations.

Simulation has been an effective educational tool for teaching learners the application of knowledge and skill and can be equally effective in assessing the learner. Another method for assessment of competency is the objective structured clinical examination (OSCE) format. An OSCE consists of several stations where the learner can be assessed as she or he performs standardized clinical tasks, which could include the use of US phantoms and standardized patients. In this type of assessment, the learner demonstrates her or his ability and skills for the evaluator. However, it is unclear if performance in a limited simulated clinical environment adequately predicts clinical performance.

Resident performance in the clinical setting can be assessed through direct observation by the supervising faculty. The benefit of direct observation is that it allows the evaluation of the learner’s performance in true clinical situations. It can be difficult to maintain standardization in scoring and evaluation with direct observation as an assessment method. Direct observation is resource-intensive and has the limitation of the Hawthorne effect if the learner is aware of the assessment. Also, due to the resource-intensive nature of direct observation, the sampling can be limited.

One method to maintain and improve the standardization of direct observation assessments is the use of a standardized tool or checklist. These standardized direct observation tools (SDOTs) can be developed independently, based on a review of relevant literature or adapted from those developed and distributed by CORD. Data Supplement S4 (available as supporting information in the online version of this paper) provides sample EUS SDOTs. Maintenance and review of a quality assurance database is an effective way to integrate self-reflection into the learning process. This also provides the ability to review learner performance in image capture and interpretation by the use of indirect observation of images, clips, or videos that are obtained by the learner. Ongoing quality assurance review as an assessment tool removes the simulation and Hawthorne effect limitations of the OSCE and direct observation methods. This review method also allows continuous performance improvement and progression through the higher-level subcompetencies.

A quality assurance database also allows residents and programs to fulfill a minimum requisite number for graduation, i.e., 150 US examinations. The authors feel that the number of completed US examinations is not sufficient to imply competency or adequate performance; other assessment methods beyond a purely numerical evaluation are necessary. Because learning curves for US can vary by learner and application, a numerical approach can only demonstrate exposure and opportunity to achieve competency.

Achieving adequate scores in knowledge and application of knowledge does not imply that learners have achieved the higher-level functions of competency and performance. And no singular assessment will be adequate for all learners at all levels. Because education methods and learning curves for EUS can vary depending upon the environment, so too can assessment methods be customized to match learner environments. Advanced-level performance is achieved through the use of assessment, focused feedback, and deliberate practice to improve. Assessment tool types and their role in the milestones subcompetency are summarized in Data Supplement S5 (available as supporting information in the online version of this paper). Each method of assessment requires different types of resources. Consequently, each residency program should evaluate the equipment, faculty time, and other required resources to determine which combination of assessment methods will best fit the program, learners, faculty, and curriculum.

Data Supplement S2 represents the solicited consensus opinion of the EUS community. Yet, as practice environments and teaching styles differ, controversy regarding designation of core versus advanced skills is expected. Moreover, the five subcompetencies for EUS have elicited controversy among EUS educators and the EUS community. Since the completion of a requisite number of US scans does not ensure a resident’s competency, future iterations of the five skill levels may be adjusted in their wording to be less focused on numbers. A meaningful assessment of a given resident’s competency in EUS requires evaluation of her or his ability to incorporate US into clinical care and rotations other than those dedicated to US.

Meaningful EUS competency assessment requires evaluation of the residents’ ability to incorporate US into clinical care, and therefore a portion of this assessment should be conducted on rotations not otherwise dedicated to EUS. The EUS community and the author group suggest a focus on methods of evaluation that measure the ability of the EM resident to integrate EUS into patient care and clinical decision-making, as opposed to emphasizing the completion of a specific number of EUS examinations. Future directions include medical education and competency assessment research that further delineate effective methods to evaluate resident performance in this core clinical skill.

LIMITATIONS

We recognize that the ability to structure a resident US rotation as outlined may not be possible at all residency programs. We also recognize that there are programs...
lacking EUS fellowship-trained faculty and/or access to EUS fellows who may serve as resident educators. We do, however, believe that all EM residency programs should identify dedicated EUS faculty to organize, perform, and assess the progression of EM residents through the subcompetencies for all core skills. Dedicated faculty are especially necessary as proving competency across the large variety of EUS core skills creates a burden that may otherwise be difficult to meet.

CONCLUSIONS

The Emergency Medicine Milestones Project, as a joint initiative of the Resident Review Committee for Emergency Medicine under the Accreditation Council for Graduate Medical Education and American Board of Emergency Medicine, has designated emergency ultrasound as a core competency skill for emergency medicine residents. A multiorganizational committee of residency and emergency ultrasound leaders formed to offer updated recommendations to emergency medicine program directors, educators, and residents. A clear delineation of a minimum standard of emergency ultrasound skills for the graduating emergency medicine resident is offered, and tools to assess competency are discussed.
